

Global Warming...

Well is it or isn't it?

For over 10 years we have been banging on about how much energy you could save by removing and preventing Limescale, the curse of the hard water. If you want soft water you install an ion exchange water softener which has to be plumbed in, requires a dedicated cold feed for drinking water, needs bags and bags of salt and then finally drains the Calcium enriched water away down the drain in what is nicely termed REGENERATION. This means that about 25 gallons of salty and Calcium rich water is flushed down the drain every time.

What a waste you might say surely there is a simpler method to treat hard water? There is and it's been around for 10 years and more and more people are finding that the LITTLE PLUMBER is the preferred alternative to the old "salty" see www.littleplumber.com These electronic units not only de-scale and prevent limescale from building up in your plumbing system but actually make the water feel softer.

The energy they save in one year is more than equal to the purchase price and running cost (£2.00 per annum) combined.

So if you want to try and save the planet from Global Warming...if you believe it exists...then try a Little Plumber electronic unit.

We estimate that if every house in the UK in a hard water area fitted one....we could close down 5 coal fed power stations and what a help to our atmosphere that would be.

If you would like to know more about any of our products call Gavin Beaumont on 01235 862540 or 07785 111744 or E-mail: enquiries@littleplumber.com www.littleplumber.com
