

Asset Monitoring...  
**...the Logically way**

-  Real-time asset monitoring
-  Minimal installation, zero disruption
-  20km Signal Range
-  Over 450 programmable sensors
-  Intelligent analytics software

## Range of parameters

We are proud to offer the largest range of parameters on the market. Whether you want to monitor ultra-low temperature -80 cold storage, GPS location, occupancy of your organisation, flood detection, vibration, water flow, electricity usage and more. We have the software platform capable of offering key data insights for your organisation.

## Technology

We are always looking for new ways to advance our IoT monitoring solution. Our current transmission infrastructure allows data to travel up to 20km. Meaning one centralised gateway can collate data from any sensor within your entire organisation. Whether it's a hospital, supermarket, university or distribution centre, our solution will provide you with reliable, consistent and real time data around the clock.

## Sensors

Whether you need discrete and small or robust and industrial. Our platform allows users to easily add and configure new sensors to your account. With a gateway infrastructure installed sensors will effortlessly connect to the nearest gateway, providing you with the accurate and uninterrupted data you need.

## Gateways

Our gateways utilise a cellular network so no need for an IT connection. Our data roaming connectivity allows for data transmission anywhere, even remote or secure locations. Gateways ensure seamless transmission with a backup power supply, and with the option to use in transit, we can monitor your entire cold chain from one dashboard.

## Cloud

Collating data from various locations to one dashboard has not always been easy, however the development of cloud based software allows us to integrate your sensor data onto our easy to use web application. We use AWS's secure network and host data indefinitely aiding with the compliance and performance analysis of your assets.

## Security

At Logicall the safety and security of personal data is our priority. That's why all of your data is end to end encrypted. The wireless communication between our sensors and the network is 2 way and personal data is kept on a secure online server and accessible by only you. And best of all our solution requires no connection to your existing network.

# How it Works...

## Sensor

Temperature, humidity and acceleration monitoring  
Near field communication (NFC) for easy configuration  
Up to 10 Year Battery life

## Gateway

Cellular roaming connectivity  
GPS Tracking capabilities  
Uninterruptible Power Supply

## Security

End to end encryption  
Mutual authentication  
Integrity protection and confidentiality

## Cloud

A secure online server  
Multiple location data storage  
Data stored indefinitely

## Software Platform

Intuitive design  
Variable user access  
Continuous development

## Installation in seconds

- ☁ Plug and Play Solution
- ☁ No IT Connection Required
- ☁ Data ready in seconds

## Easy to use

- ☁ Simple and intuitive platform
- ☁ Accessible anytime, anywhere
- ☁ Secure and Reliable

## Easy to maintain

- ☁ Add or remove users yourself
- ☁ Dictate users access levels
- ☁ Control assets and alarms yourself
