

## Trade Circular Dome Units (Clear Triple Skin)

### Product Information

Trade clear circular dome roof lights are supplied with a non vented GRP kerb and pre-drilled triple glazing allowing the installer to screw fix the glazing to the kerb.

The pre-drilled fixing holes are positioned using state of the art cutting technology, ensuring a reliable and accurate fit every time.

Once installed, security caps encase the fixings for additional security. The security caps are designed to improve waterproofing and reduce the likelihood of forced entry via the rooflight. The security caps are extremely difficult to remove after installation.

The circular roof dome range is Part "L" compliant to conform to the current building regulation. It has a triple polycarbonate glazing, to suit all thermal performance requirements.

The design provides exceptional waterproofing integrity and water ingress is virtually impossible.

The glazing can be supplied in a curved dome or pyramid profile. The high impact polycarbonate glazing and GRP kerb make the Trade circular roof domes a robust and reliable rooflight option.
