

Every year thousands of workers get killed or injured while performing repairs or maintenance on industrial equipment or machinery. Many of these accidents are caused by the uncontrolled release of energy. In Europe however, several regulations exist, requiring that all energy sources are turned off and 'locked out' while machinery is being serviced or repaired.

Identipro can help you **protect your workers and contractors** with our wide range of devices for locking out all types of **valves, electrical switches, circuit breakers, pneumatics and plugs.**

Innovative and versatile devices which are easy to use and re-use.
