- Space Saver
- Branded Bottles

consumables

Full range of cups and accessories

- Plastic Cups & Trays
- Beca Bins
- Sports Bottles
- Cup Dispensers

performance

We believe in looking after our customers and are proud that we continue to get top marks from our customers in our annual customer satisfaction surveys. This is due to the commitment of our staff and the investment we make in their training and development. We have over 60 in-house engineers nationwide that are fully trained and experienced to take care of all our customers. No other mains fed water provider has the depth of experience with all types of water dispensers or the coverage to respond to customers nationwide as PHS Waterlogic.

innovation

PHS Waterlogic is the leading supplier of superior quality water purifying and dispensing systems and has helped to shape the evolution of the modern water cooler. With each water cooler extending the boundaries of performance and purity, but also setting new industry standards in such areas as design through to significantly improved looks and usability. We pride ourselves in providing our customers with the latest products in terms of features and function as well as style and looks.

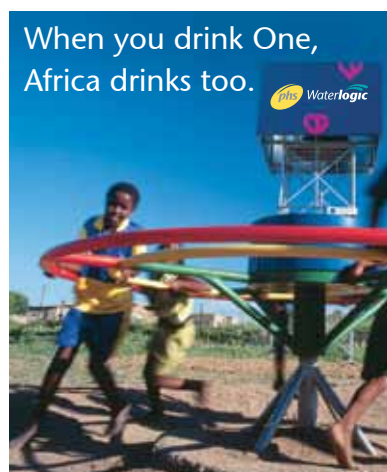

service package

Totalcare

Unlike many Watercooler suppliers, PHS Waterlogic offers a Totalcare package with no other costs or surprise hidden charges. With our Totalcare package it's all included, chose any Waterlogic watercooler, and it will be delivered, installed and maintained by trained PHS Waterlogic service engineers. Totalcare includes twice-yearly planned preventative servicing, including all parts and labour, and a full call-out and repair service, available the next working day. These services are facilitated from a 24-hour, seven day manned customer service centre, ensuring customers can always receive the service they need.

corporate social responsibility

The One Foundation

As Europe's largest supplier of mains fed drinking water dispensers, it only seemed right that we chose a foundation to help others in the world gain access to clean, safe drinking water like we provide our customers. By taking a 'One' branded watercooler you are not only providing staff, customers and visitors with clean, safe drinking water, you are also helping to fund PlayPump® water systems for communities in Africa.

environmentally focused

Mains fed drinking water is demonstrably more environmentally sustainable and friendlier, than bottled water. The bottled water alternatives lead to large quantities of plastic waste, very little of which is recycled and what cannot be recycled goes to landfill. The carbon emissions generated in delivering bottled water and the road miles required to ensure constant water supply also result in considerable damage to the environment. Filtering and chilling mains fed water on site with a PHS Waterlogic dispenser does away with the need for large non-biodegradable plastic bottles and constant deliveries.

WEEE

Directive on waste electrical and electronic equipment

An independent study undertaken by an Environmental Consultancy, Sustain, proved that a PHS Waterlogic watercooler compared to a bottled watercooler has up to 72% less carbon footprint.*

PHS Waterlogic's water dispensers are also environmentally friendly in many other ways; sleep mode option reduces energy use and many materials and parts used are recyclable. Units for recycling are passed on to a local registered A.A.T.F. (Approved Authorised Treatment Facility) where 98% of component parts are separated and recycled in accordance with the WEEE directive.

PHS Waterlogic takes environmental responsibility very seriously and as a supplier, can help customers achieve their own environmental goals.

**Cf over 5 years and based on WL2000 compared to an average BWC delivering 280 litres of water per month.*
