

SAFETY TILES

Safety Tiles

These safety tiles are prefabricated porous tiles, 1meter x 1 meter in size. These have become less popular in more recent years but still have a place in certain situations.

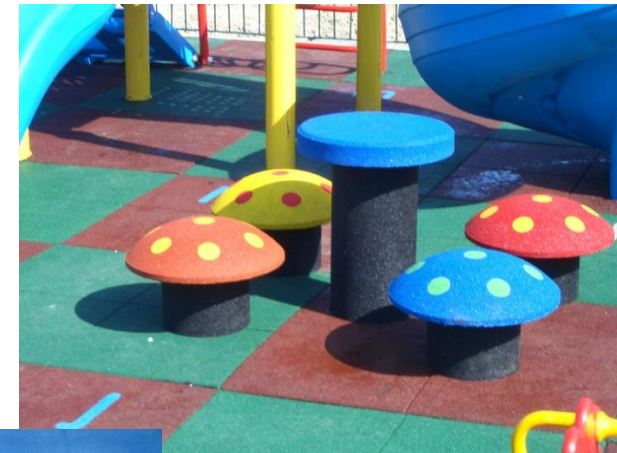

The [rubber tiles](#) are ideally suited to play areas which are less accessible or smaller sites where clients (or local contractors) prefer to complete their own installation.

They are available in thicknesses from 20mm to 105mm thick, depending on any Critical Fall Height [CFH] requirements.

We recommend a flat solid sub base which has adequate drainage provision. The tiles are laid by bonding them to a prepared concrete base using a Tile Adhesive (available in a 330ml cartridge). These are a SUPPLY ONLY item.

The Safety Tiles made from shredded rubber which are pressure moulded using the same shred throughout. All tiles are tested to EN1177 and BS7188 and all comply or exceed their criteria.

They are available in Black SBR as standard but can be dyed during manufacture using a green or terracotta red pigmented binder. The rubber tiles are used for [safety surfacing](#),

Water House, 35 Water Lane, Wilmslow, Cheshire, SK9 5AR
