

PRE-FABRICATED SHOCKPAD

PRE-FABRICATED SHOCKPAD

A shockpad is a resilient layer introduced between the sub base and the playing surface. The shockpad is used to provide a degree of comfort to players, cushioning the impact on joints / muscles and generally improves the playing characteristics of the synthetic grass [sports surfaces](#) as well as prolonging the life of the carpet.

Prefabricated shockpads are designed to assist with the prevention of rucking, creasing or movement in the final sports surface.

System depths can vary from 10mm-35mm depending on the bounce modifier test criteria.

One disadvantage of this shockpad is that it can only follow the contour of the sub base and will not flatten out any undulations or imperfections in the sub base.
