

## Caring for Natural Stone

### Sealing Stone

All natural stone, even polished granite, is porous and we recommend that stone used in domestic interiors should be sealed to prevent staining.

Amarestone recommends and stocks stone impregnators produced by Fila, an Italian company specialising in products for the care and maintenance of stone and other natural materials.

**Fila MP90** is excellent for the protection of polished surfaces of marble, granite and the harder limestones. For unpolished stone, e.g. antiqued, tumbled or honed surfaces, **Fila Hydrorep** and **Fila Fob** have been specially formulated to provide the highest level of protection against stains caused by water and grease. We can advise which sealer is best suited to your choice of stone.

Fila MP90, Hydrorep and Fob do not alter the appearance of the stone. However, Fila StonePlus can be used to deepen the colour of stone and provide the same high level of protection. For further details, please call Amarestone.

These Fila stone impregnators have been approved for use on food preparation surfaces and are therefore safe to use on kitchen worktops.

To add further protection to the stone, waxes can be applied to give a matt, satin or gloss finish.

You can download further free technical information on how to choose stone and how to maintain natural stone from our web site or by sending an email to [sales@amarestone.com](mailto:sales@amarestone.com).
