

WHICH LITTLE PLUMBER DO YOU NEED?

It is really important to buy the right Little Plumber units and the choice will depend on your plumbing system - is it vented or unvented? That is the question !!

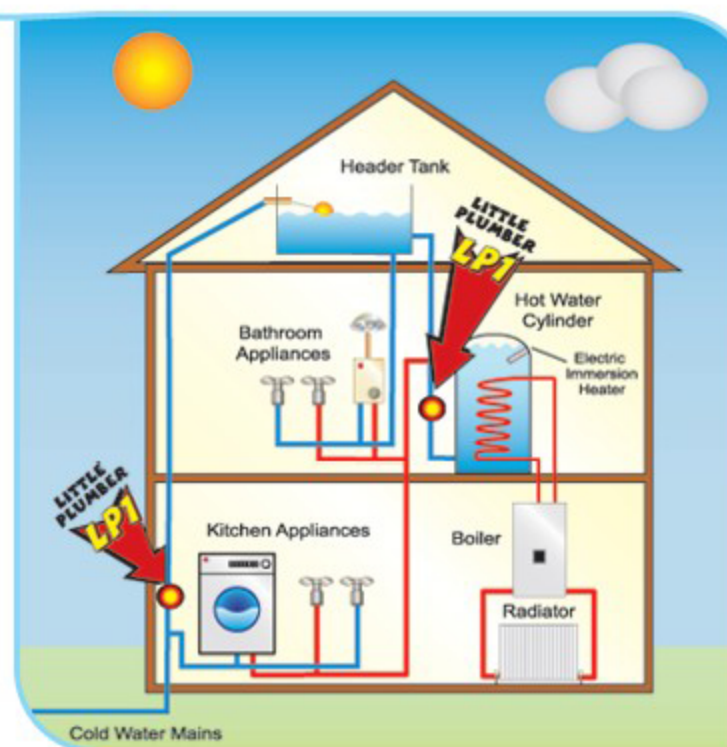

UNVENTED

It really doesn't matter where you install your LP unit as long as it's on the COLD mains pipe. This is because the LP puts a "current" in the water like a beam of light, which travels up-stream and down-stream to the remotest parts of the cold plumbing system. It is NOTHING to do with the direction of the water flow Don't worry about what the pipe is made of. LP works very well on all pipes including plastic, galvanised and copper. If you have a bigger property with say 5+ bedrooms you will need an LP2 on the cold pipe and you may also consider a dedicated LP1 on the cold feed to the boiler if the house has several bathrooms.

VENTED

LP units will only treat the water if there is no break in it. With a tank in the loft, the water fills up the tank through a ball valve so there is a break in the current. The water in the tank becomes untreated. You will either need to install 2 x LP1's, one on your cold mains and one on the cold down service or if your cold mains pipe to the tank in the loft and the cold down service to your hot water cylinder run parallel together in your airing cupboard as they often do, you can fit an LP2, one aerial is wrapped around the cold mains and the other is wrapped around the cold down service. Don't forget that the LP2 has 4 times the output of the LP1.

1-4 bed house	1-4 bed house	5+ bed house	small hotels care homes	50 bed hotels or similar buildings	large hotels, office blocks factories and hospitals
LP1	SOLO	LP2	LP3	LP4	LP5
£96.90	£165.60	£165.60	£454.25	£908.50	£1817.00

The LP Solo (battery powered - the only one in the world) is equivalent in output to an LP1.

Larger properties with 10+ bedrooms will require a LP3 on the mains inlet and a LP2 on the cold down service. If you have a secondary return pipe to the boiler then another LP2 should be fitted.
