SYSTEM HYGIENICS

A fresh look at chute cleaning...

Refuse chutes can be major sources of unpleasant odours in tower blocks, as well as potential health hazards. Their height and shape have, in the past, made them awkward and difficult to clean effectively and, when they are left to fester, a build-up of bad smells and bacteria begins.

Nationally renowned System Hygienics, the ventilation hygiene market leader, has developed **sidewinder** – the fresh solution to chute cleaning specially designed for tower blocks and flats.

sidewinder's high-powered, remotely operated jet cleaning service uses a unique spinning head design in conjunction with new hot water technology to ensure chutes are cleaned thoroughly, quickly and effectively, with minimal disruption to the site.

A high-pressure hot water system connected to a winch with a high velocity spinning head sprays a constant jet of hot water at 350 bar. The unique design utilises up to 50% less water than conventional high pressure water systems. Mixed with a biodegradable detergent that kills 99% of smells, this jet of water is carefully controlled as it is lowered down the chute ensuring a thorough, even clean that removes harmful bacteria and foul odour microbes from the surface.

All waste is washed down the chute and is collected, leaving it thoroughly cleaned and smelling fresh – all in a few short hours with minimal disruption to tenants and low environmental impact.

The **sidewinder** system is a self-contained unit, only requiring a water supply and drainage at the base of the chute. Everything else is part of the first class service customers can expect from System Hygienics.

Because **sidewinder** is run by System Hygienics, you will receive a great, reliable job from our own fully trained, SKILLcard-accredited staff.
