

'ELECTRAD'

ELECTRICAL CONVERSION ELEMENTS

Tuscan are pleased to offer the latest addition to their range. Imagine a stylish cast iron radiator with its traditional looks and heating qualities, but requiring no plumbing or attaching to your existing system. Our ElectRad incorporates a heating element, so they really can be installed anywhere for maximum convenience. Temperature settings are adjustable and include a "frost protection" option.

ElectRads are available for all 11 models in the Victorian and Nouveau ranges, with thermostatic control and heat-outputs up to 1.5Kw.

Applications for the ElectRad range include conservatories, loft conversions, hotels, offices, listed building, museums and many more. ElectRad radiators can be used in locations

where the installation of a traditional wet plumbed system would be impractical or cause disruption to the existing building fabric.

ElectRad radiators require no pipework and can be plugged directly into a standard wall socket or hard wired into your electrical system (please consult a qualified electrician for specific application advice).

The perfect solution for that period look, with the convenience of electrification.

To discuss your requirements or for more advice on this welcome addition to our range please contact us on the number shown overleaf.
