KITO HOISTS- Always on the safe side

The Long One

Secure and synchronous lifting

Extract from the publication
dima 4/2009

Synchronous motion cycles in one hoist. The TWER2M double hook electric hoist is ideal wherever loads must be kept horizontal or you need to lift and lower loads simultaneously: It is primarily designed for rolled profile girders and is used especially to handle long goods, such as pipes and profile rods, etc. The hooks can be spaced according to the long goods and to customer specifications.

The developers at KITO stress that the operator does not need to guide the load manually. Frequency inverter operation takes care of this, allowing loads to be positioned gently with pinpoint accuracy.

..... It is equipped with double load chain gear, which keeps the chain synchronous. This saves the customer from buying two chain hoists, as this task is normally affected with two hoists running synchronously. This technical configuration gives KITO a unique selling point - from both a technical and pricing perspective.
